Introduction/Actions/Assumptions/Result Summary:

Introduction:

TSA was instructed by Concorde Glass Ltd to provide the below Calculations:

1- Provide fixing details for the side-mounted U Channel system into concrete, steel, and timber.

Actions:

Balustrade load = 0.74kN (Table NA.6 IS1991-1-1:2002)

Point load = 0.5kN (Table NA.5 IS1991-1-1:2002)

Typical High Wind load = 2.5kN/m^2

Assumptions:

Concrete Grade = C30/37

Bolts are grade 8.8 Mild Steel.

Timber Grade = C16 (minimum)

Aluminium Shoe grade 6063-T6 – Minimum strength is 195Mpa.

Result Summary:

A. Side Fix Mount U – Channel:

1- **Connection to Concrete**: Use 1No. Ultracut FBS II 10×65 Zinc Plated Steel Fischer Countersunk Concrete screws @200mm C/C with Minimum Embedment depth is 43mm and Minimum edge distance is 70mm.

2- **Connection to Steel:** Use M10 Grade 8.8 Countersunk bolts @200mm C/C.

3- **Connection to Timber:** Use M10 Grade 8.8 Countersunk bolts @200mm C/C.

4- **Shoe:** 136×66mm Aluminium Shoe.

Glass Strength

Balustrade Loading:

< 5mins duration => $k_{mod} = 0.77$

$f_{gd} = (k_{mod})(k_{sp})(f_{gk})/\ \gamma_{ma} + k_v(f_{bk}-f_{gk})/\gamma_{mv}$

$f_{gd} = (0.77)(1.0)(45)/1.6 + 1.0(120\text{-}45)/1.2$

$\underline{f_{gd} = 84.2N/mm^2}$

Wind Loading:

10min duration, Multiple Gust Storm => $k_{mod} = 0.74$

$f_{gd} = (k_{mod})(k_{sp})(f_{gk})/\ \gamma_{ma} + k_v(f_{bk}-f_{gk})/\gamma_{mv}$

$f_{gd} = (0.74)(1.0)(45)/1.6 + 1.0(120\text{-}45)/1.2$

$\underline{f_{gd} = 83.3N/mm^2}$

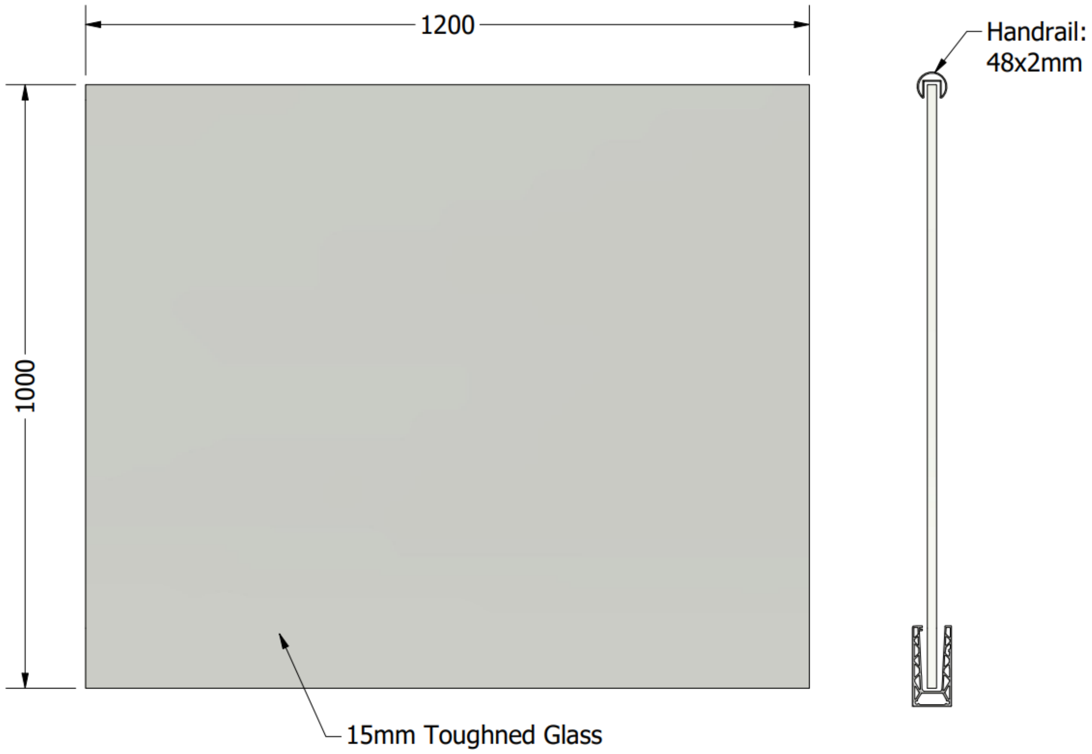
Side Mount Shoe – Side Fix Connections:

Sketch of System:



Note:

1- toughened glass is not permitted to bear horizontal balustrade loading on its own. As a result, a handrail must be designed specifically to support the horizontal balustrade load.

Connection to Concrete Design - Side Fixed:

Moment due to Balustrade Load $= 0.74\text{kN/m} \times 1.5 \times 0.6\text{m} \times 0.6\text{m} = 0.4\text{kNm (ULS)}$

Moment due to Wind Load $= 2.5\text{kN/m}^2 \times 1.5 \times 0.6\text{m} \times 0.6\text{m} \times 0.33\text{m} = 0.45\text{kNm (ULS)}$ – Worst Case.

Shear Load due to Balustrade load $= 0.74\text{kN/m} \times 1.5 \times 0.6\text{m} = 0.666\text{kN (ULS)}$

Shear Load due to Wind load $= 2.5\text{kN/m}^2 \times 1.5 \times 0.6\text{m} \times 0.6\text{m} = 1.35\text{kN (ULS)}$ – Worst Case.

Therefore, use 1No. Ultracut FBS II 10×65 Zinc Plated Steel Fischer Countersunk Concrete screws@200mm C/C with Minimum Embedment depth is 43mm and Minimum edge distance is 70mm as per the screenshot below.

Connection To Mild Steel Baseplate - Side Fixed:

M10 Grade 8.8 Countersunk Bolt:

$f_{ub} = 800\ MPa$ *(Grade 8.8 Mild Steel, Table 3.1 EN 1993-1-8:2005)*

$\alpha = 0.6$ *(Table 3.4 EN 1993-1-8:2005)*

$A = 58.00mm^2$ *(For M10 Bolts)*

$K_2 = 0.63$ *(Table 3.4 EN 1993-1-8:2005)*

$\lambda_{m2} = 1.25$ *(Table 5.1 EN 1993-1-4:2006)*

Tensile Resistance Check: *(Table 3.4 EN 1993-1-8:2005)*

$F_{t,Ed}$: *is the design tensile force per bolt for the ultimate limit state.*

$F_{t,Rd}$: *is the design tension resistance per bolt.*

$F_{t,Ed} = 2.7kN$

$F_{t,Rd} = \frac{K_2 F_{ub} A}{\lambda m2} = \frac{0.63\ x\ 800\ x\ 58}{1.25}\ x\ 10^{-3} = 23.38kN \rightarrow F_{t,Rd} = 23.38kN > 2.7kN$ **Okay**

Shear Resistance Check: *(Table 3.4 EN 1993-1-8:2005)*

$F_{v,Ed}$: *is the design shear force per bolt for the ultimate limit state.*

$F_{v,Rd}$: *is the design shear resistance per bolt.*

$F_{V,Ed} = 0.45kN$

$F_{V,Rd} = \frac{\alpha F_{ub} A}{\lambda m2} = \frac{0.6\ x\ 800\ x\ 58}{1.25}\ x\ 10^{-3} = 22.27kN \rightarrow F_{V,Rd} = 22.27kN > 0.45kN$ **Okay**

Combined Shear & Tensile Resistance Check: *(Table 3.4 EN 1993-1-8:2005)*

$\frac{F_{v,Ed}}{F_{v,Rd}} + \frac{F_{t,Ed}}{1.4 F_{t,Rd}} \leq 1 \rightarrow \frac{0.45}{22.27} + \frac{2.7}{1.4\ x\ 23.38} = 0.103 \leq 1$ **Okay**

Therefore, Use M10 Grade 8.8 Countersunk Bolts @200mm C/C.

Connection To Wood - Side Fixed:

Tensile Resistance Check:

$\text{Tensile Force per screw} = 2.7\text{kN}$

$\text{Tension Capacity of } 10 \times 40\text{mm Coach Screws} = 26.45\text{kN}$ as per specification sheet in appendix A.

$\text{Therefore}, 26.45\text{kN} > 2.7\text{kN}$ **Okay**

Minimum edge distance required is 5d = 5 x 10 = 50mm.

Therefore, use M10 countersunk bolts. @200mm C/C.

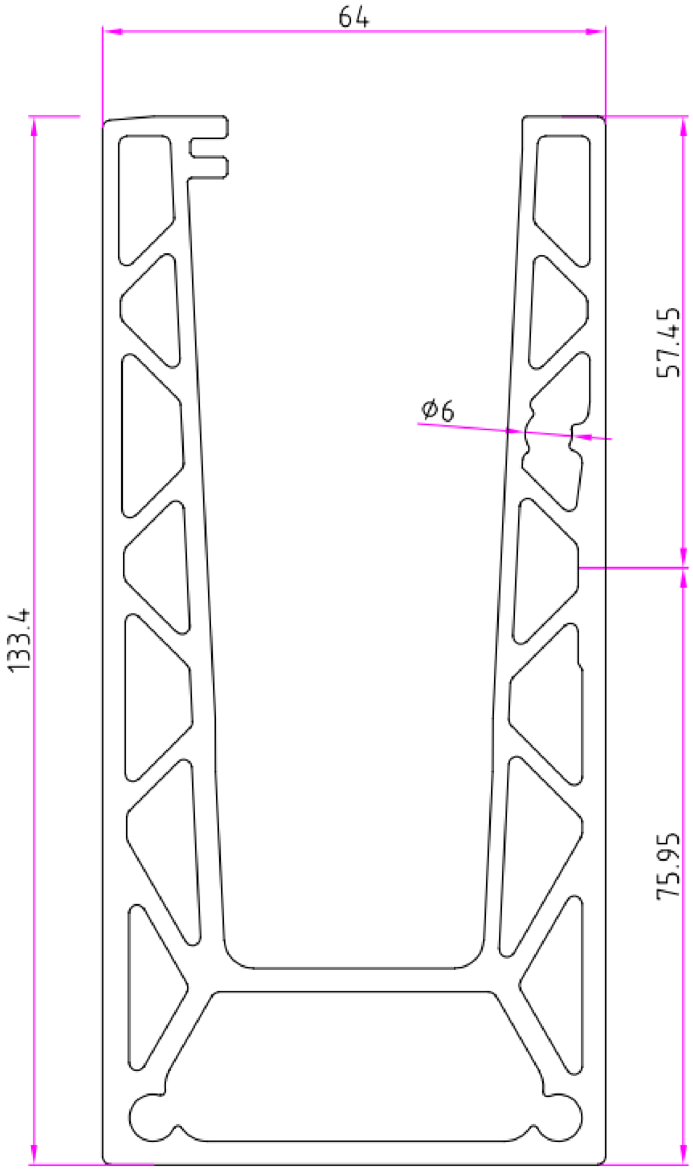
Shoe Analysis:

System Sketch:



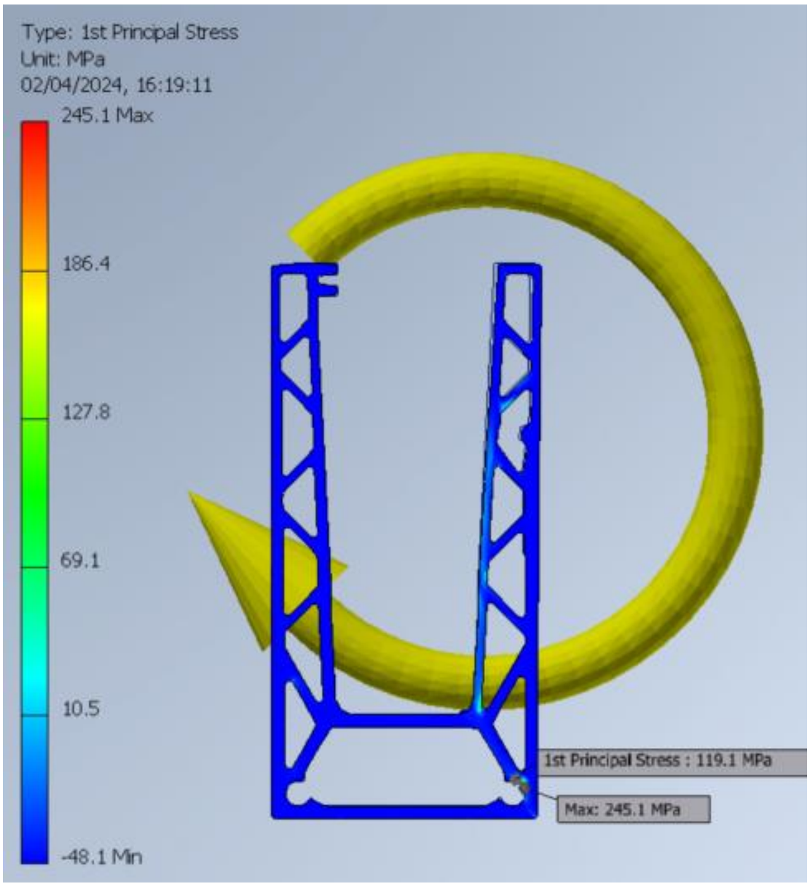
Bending Stress of Shoe:

- Analysis Software was used to determine maximum bending stress of the shoe due to maximum Moment.
- $\text{Moment}_{Wind} = 2.5\text{kN/m2} \times 1.2\text{m} \times 1.0\text{m} \times \frac{1.0\text{m}}{2} = 1.5\text{kN m(SLS)}$ **Worst Case**
- $\text{Moment}_{Balustrade} = 0.74\text{kN/m} \times 1.2\text{m} \times 1.0\text{m} = 0.89\text{kN m(SLS)}$

Result:

Max. Bending Stress = 119.1N/mm^2 x1.5 = 178.65N/mm^2 < 195N/mm^2

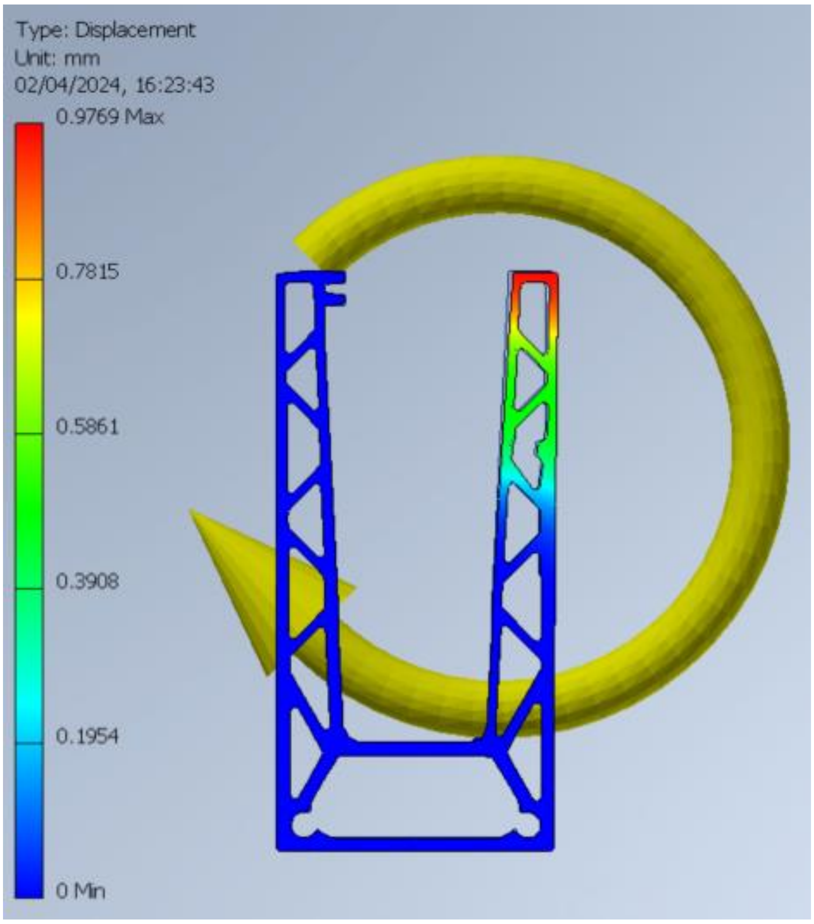
Okay in Bending



NOTE:

In this case the 245.1 MPa is a localised stress. The most appropriate stress to be considered is 119.1 MPa.

Deflection of Shoe:



NOTE:

- Deflection 0.9769mm at the top of shoe
- Max. Deflection at the top of the glass = (0.9769 x 1000)/86 = 11.36mm

DECLARATION OF PERFORMANCE

DOP7 v2

We here by declare the following designated products

TIMco Coach Screws DIN571
Diameter 6.0mm, 8.0mm, 10.0mm, 12.0mm

Have been tested by the following independant testing organisation:

- Notified Body 1015
  Strojirensky Zkusebni Ustav, s.p., Czech Republic

And that they have performed initial type testing under system 3, Annex V of the regulation (EU) no. 305/2011 (Construction Products Regulation), with the reference to the harmonised European standard (hEN) BS EN 14592:2008+A1:2012 (Timber structures - Dowel type fasteners - Requirements) for nails intended for the use in "load bearing timber structures" and produced the calculation/test reports and certificates as listed below;

Certificate Number: E-30-20414-13, E-30-20405-13, E-30-20406-13, E-30-20407-13.
Test Report Number: No. 30-9915/1 to No. 30-9915/4.

Factory Process Control (FPC) has been established by the factory and independently audited by TUV Rheinland UK in accordance with ISO9001:2008..

This declaration of conformity is valid until there is a significant change in the product and declared characteristics. ie. raw material or change in production process.

Technical remarks

All data and information in the software is based on fischer products and common engineering knowledge. Please check all the proof results against local valid standards and approvals.
As fischer is not the design office, the attached is no guarantee for incorrect input or assumptions. Any recommendations have to be approved by the building-authority or project engineer. Results are valid only for anchor system calculated in the attached. If any part of the system is changed, it will invalidate this report and new calculations would be required. The calculation was done under the assumption that a sufficient splitting reinforcement is available. In this case the spliiting failure can be omitted.
The transmission of the anchor loads to the supports of the concrete member shall be shown for the ultimate limit state and the serviceability limit state; for this purpose, the normal verifications shall be carried out under due consideration of the actions introduced by the anchors. For these verifications the additional provisions given in the current design method shall be taken into account.
As a pre-condition the anchor plate is assumed to be flat when subjected to the actions. Therefore, the plate (if present) must be sufficiently stiff. The C-Fix anchor plate design is based on a proof of stresses and does not allow a statement about the stiffness of the plate. The proof of the necessary stiffness is not carried out by C-Fix.

During the design process, the following hints and warnings were issued:

- Measures must be taken to fill the annular gap on site.
