# Base plate installation

We always recommend you mark and layout your post system prior to starting your installation. Once you have checked your posts are all in the correct locations from the drawings provided you can start to drill your anchor points.

It is a good idea to start one end and work along each run to its completion. The ground

surface needs to be flat but metal shims can be used in the event there is some minor deviances. Once the posts are all in position you can then look to fit your handrail system followed by the glass into the clamps using your allen keys.
